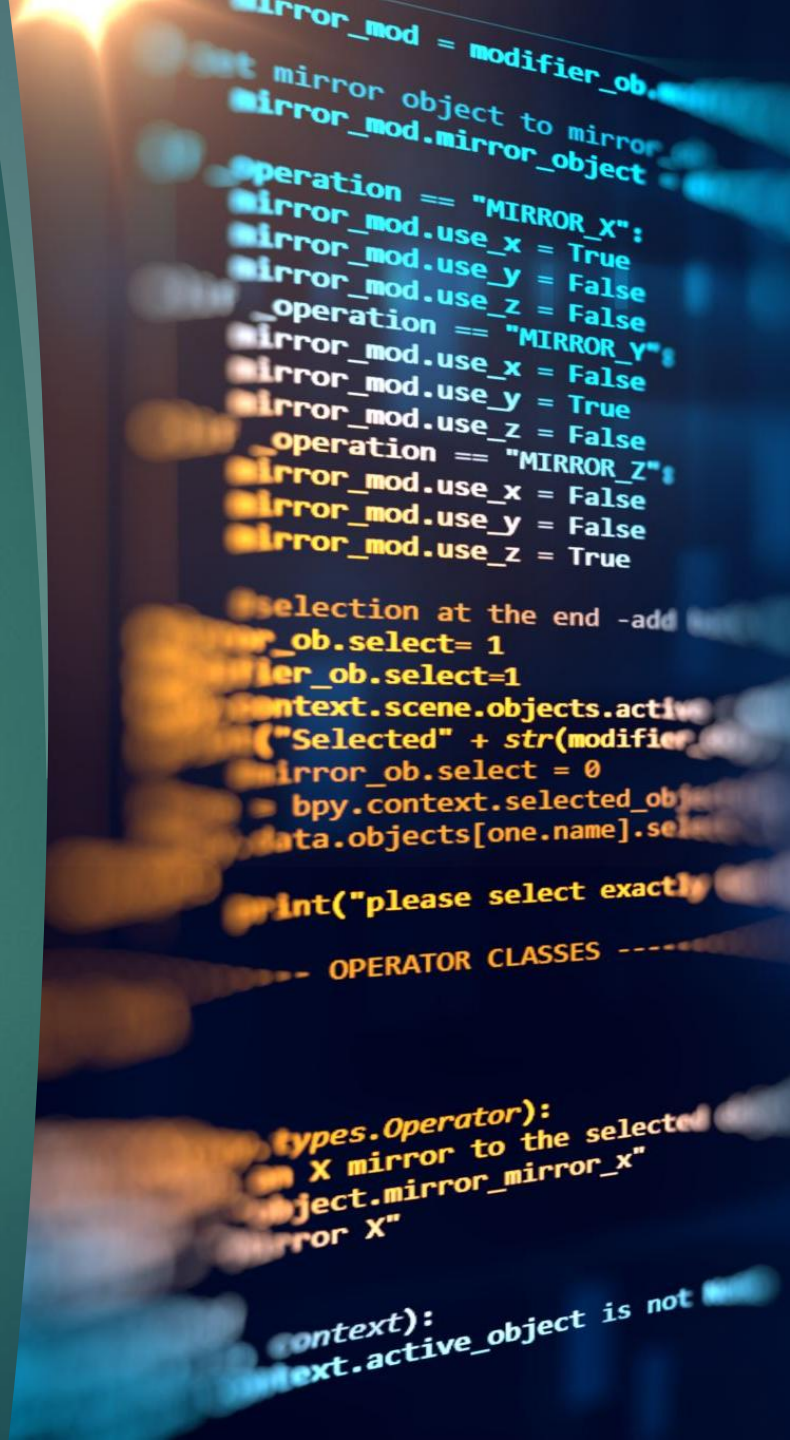
PowerShell Cmdlets & Intune Application Packaging

GROUP - A

Introduction to PowerShell Cmdlets

- **1. What is a Cmdlet?**
- **Cmdlet** = *Command-let* → A lightweight command used in the PowerShell environment.
- Written in **.NET Framework** or **.NET Core**.
- Executes within the PowerShell process (not a separate process like `.exe` files).
- **Always returns objects**, not plain text (unlike Command Prompt commands).
- **Case-insensitive** — `Get-Process` = `get-process` = `GET-PROCESS`.



Common PowerShell Cmdlets

- **Set-Content**: Writes or replaces the content of a file.
- **Copy-Item (cp)**: Copies files or folders.
- **Move-Item (mv)**: Moves files or folders.
- **Remove-Item (del/erase/rm)**: Deletes files or folders.
- **Get-Process**: Retrieves information about running processes.

Benefits of Using PowerShell Cmdlets

- Automates repetitive tasks.
- Integrates easily with scripts.
- Rich output formatting.
- Supports remote management.
- Works with Windows, Azure, Intune.
- **Cross-platform support** (Windows, Linux, macOS with PowerShell Core).
- **Can interact with APIs** and cloud services directly.
- **Pipeline processing** makes complex tasks easier.
- **Huge library of built-in cmdlets** and support for custom ones.
- **Easily schedulable** with Task Scheduler for automation.

Introduction to Intune Application Packaging

- • Microsoft Intune = Cloud-based device & application management platform
- • Application Packaging = Preparing software for deployment
- • Intune uses .intunewin format for Win32 apps
- • Supports MSI, EXE, and other installers
- Ensures consistent installation across multiple devices

Intune Supported App Formats

- • .intunewin (Win32)
  • Microsoft Store apps
  • Line-of-business apps
  • Web apps
  • Diagram can show relationship between app types.

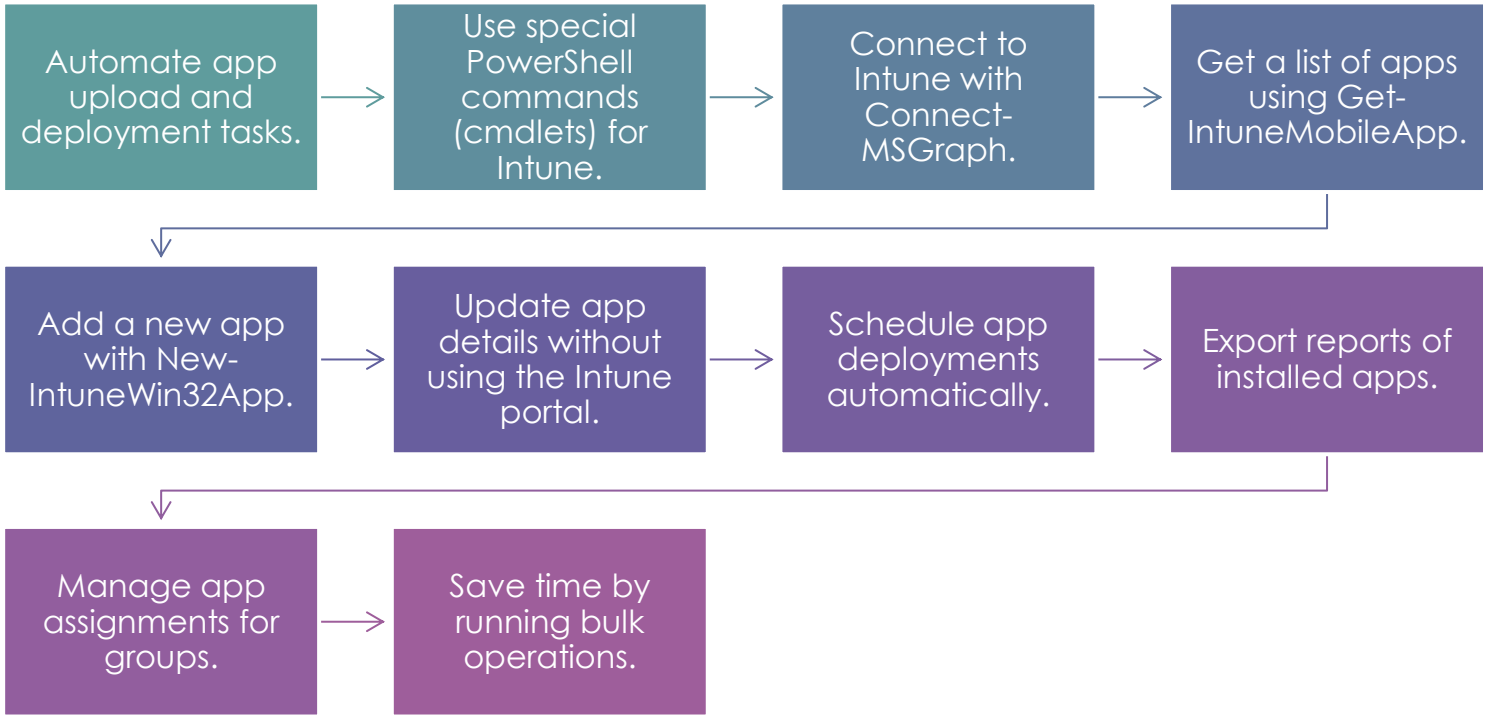
Steps to Create an Intune App Packag

- **Prepare App Files** – Gather the application installer (EXE/MSI) and required dependencies.
- **Convert to .intunewin** – Use the Microsoft Win32 Content Prep Tool to package the installer into .intunewin format.
- **Upload in Endpoint Manager** – In Microsoft Endpoint Manager, go to **Apps** → **Windows** → **Add** → **Win32 app** and upload the .intunewin file.
- **Configure App Details & Rules** – Set app name, description, install/uninstall commands, detection methods, and requirements.
- **Assign & Deploy** – Select user/device groups, review settings, and deploy the app package.

Deploying an App via Intune

- Sign in to Intune Admin Center, go to **Apps** → **Add**, and upload the packaged app (`.intunewin`, MSI, etc.).
- Enter app details, set silent install/uninstall commands, and configure detection rules and requirements.
- Assign to users/devices as **Available** or **Required**, then monitor deployment status and fix any issues.

Using PowerShell with Intune



Conclusion

PowerShell cmdlets help in fast and automated work.

Intune packaging makes app deployment easy and reliable.

Together, they save time and reduce manual effort.

Automation reduces errors in deployments.

Can work for both small and large organizations.

Useful for IT admins managing many devices.

Helps keep devices updated with the latest apps.

Learning these tools is a good skill for IT careers.

Always test before deploying to all users
